

ABSTRACT OF THE DISCLOSURE

A view transformation matrix that represents the position/attitude of an HMD is generated based on a  
5 signal that represents the position/attitude of the HMD (S602). On the other hand, landmarks and their locations are detected based on a captured picture (S604) and a calibration matrix  $\Delta M_c$  is generated using the detected locations of the landmarks (S605). The  
10 position/attitude of the HMD is calibrated using the view transformation matrix and calibration matrix  $\Delta M_c$  generated by the above processes (S606), a picture of a virtual object is generated based on external parameters that represent the position/attitude of the  
15 calibrated HMD, and a mixed reality picture is generated (S607). The generated mixed reality picture is displayed in the display section (S609).
